Paul Erdős famously spoke of a book, maintained by God, in which was written the simplest, most beautiful proof of each theorem. The highest compliment Erdős could give a proof was that it "came straight from the book." In this case, I find it hard to imagine that even God knows how to prove the Sensitivity Conjecture in any simpler way than this.

Observation

For $f: \{0,1\}^n \to \{0,1\}$, $bs(f) \ge s(f)$.

Question 1

Question 1

Is it possible that bs(f) > s(f)?

• Yes! Let $f: \{0,1\}^8 \to \{0,1\}$ be such that f(x) = 1 if and only if the number of 1's in x is either 4 or 5.

Question 1

- Yes! Let $f: \{0,1\}^8 \to \{0,1\}$ be such that f(x) = 1 if and only if the number of 1's in x is either 4 or 5.
- For most inputs x, e.g., x = 00000000, s(f, x) = 0.

Question 1

- Yes! Let $f: \{0,1\}^8 \to \{0,1\}$ be such that f(x) = 1 if and only if the number of 1's in x is either 4 or 5.
- For most inputs x, e.g., x = 00000000, s(f, x) = 0.
- For x = 11100000, $f(x^{\{i\}}) \neq f(x)$ for $i \in \{4, ..., 8\}$, so s(f, x) = 5. Indeed, s(f) = 5.

Question 1

- Yes! Let $f: \{0,1\}^8 \to \{0,1\}$ be such that f(x) = 1 if and only if the number of 1's in x is either 4 or 5.
- For most inputs x, e.g., x = 00000000, s(f, x) = 0.
- For x = 11100000, $f(x^{\{i\}}) \neq f(x)$ for $i \in \{4, ..., 8\}$, so s(f, x) = 5. Indeed, s(f) = 5.
- For x = 11110000, then $\{1\}, \{2\}, \{3\}, \{4\}, \{5, 6\}, \{7, 8\}$ are 6 disjoint, **sensitive** blocks for f, so $bs(f) \ge 6 > s(f)$.

Question 2

How large can bs(f) be compared to s(f), asymptotically?

Question 2

How large can bs(f) be compared to s(f), asymptotically?

Theorem (Rubinstein 1995)

There exists an infinite family of Boolean functions f such that

$$bs(f) = \Omega(s(f)^2)$$
.

Question 2

How large can bs(f) be compared to s(f), asymptotically?

Theorem (Rubinstein 1995)

There exists an infinite family of Boolean functions f such that

$$bs(f) = \Omega\left(s(f)^2\right).$$

Define $f: \{0,1\}^{n^2} \to \{0,1\}$ as

$$f(x_{11},...,x_{nn}) = \bigvee_{i=1}^{n} g(x_{i1},...,x_{in}),$$

where $g(x_1,...,x_n)$ if and only if $x_j=x_{j+1}=1$ for some $j \in [n-1]$, and all other $x_k=0$.

Claim

$$bs(f) \geq bs(f,0) = \Omega(n^2).$$

Proof.

Claim

$$bs(f) \ge bs(f,0) = \Omega(n^2).$$

Proof.

Claim

$$bs(f) \ge bs(f,0) = \Omega(n^2).$$

Claim

$$s(f) = O(n)$$
.

Proof.

• Case 1: f(x) = 0. Each row must output 0.

Claim

s(f) = O(n).

Proof.

• Case 1: f(x) = 0.

Each row must output 0.

There are at most two sensitive indices on each row, e.g.,

0 ... 0 1 0 ... 0

Claim

s(f) = O(n).

Proof.

• Case 1: f(x) = 0.

Each row must output 0.

There are at most two sensitive indices on each row, e.g.,

Hence, $s(f,x) \leq 2n$.

Claim

s(f) = O(n).

Proof.

• Case 1: f(x) = 0.

Each row must output 0.

There are at most two sensitive indices on each row, e.g.,

Hence, $s(f,x) \leq 2n$.

• Case 2:
$$f(x) = 1$$
.

Claim

s(f) = O(n).

Proof.

• Case 1: f(x) = 0.

Each row must output 0.

There are at most two sensitive indices on each row, e.g.,

Hence, $s(f,x) \leq 2n$.

- Case 2: f(x) = 1.
 - If two rows output 1, s(f, x) = 0.

Rubinstein's Function

Claim

$$s(f) = O(n).$$

Proof.

• Case 1: f(x) = 0.

Each row must output 0.

There are at most two sensitive indices on each row, e.g.,

Hence, $s(f, x) \leq 2n$.

- Case 2: f(x) = 1.
 - If two rows output 1, s(f, x) = 0.
 - If only one row outputs 1, $s(f, x) \le n$.

Sensitivity vs. Block Sensitivity

Question 3 (Nisan and Szegedy 1992)

Is bs(f) always polynomial in s(f)?

Sensitivity vs. Block Sensitivity

Question 3 (Nisan and Szegedy 1992)

Is bs(f) always polynomial in s(f)?

Theorem (Huang 2019)

For every Boolean function f,

$$bs(f) \leq s(f)^4$$
.

Definition

Complexity measures α, β of Boolean functions are **polynomially related** if there exist polynomials p_1, p_2 such that for every Boolean function f,

$$\alpha(f) \leq p_1(\beta(f)), \qquad \beta(f) \leq p_2(\alpha(f)).$$

Definition

Complexity measures α, β of Boolean functions are **polynomially related** if there exist polynomials p_1, p_2 such that for every Boolean function f,

$$\alpha(f) \leq p_1(\beta(f)), \qquad \beta(f) \leq p_2(\alpha(f)).$$

Theorem (Hatami, Kulkarni, and Pankratov 2010)

The following complexity measures are polynomially related:

- block sensitivity
- decision tree complexity
- certificate complexity
- degree as polynomial

- o approximate degree
- randomized query complexity
- o quantum query complexity

So if, as is conjectured, sensitivity and block-sensitivity are polynomially related, then sensitivity—arguably the most basic of all Boolean function complexity measures—ceases to be an outlier and joins a large and happy flock.

— Scott Aaronson²

$$|\lambda_1|\cdot|v_j|=|\lambda_1v_j|$$

Lemma

Let G be an m-vertex undirected graph. Let $A \in \mathcal{M}_m(\{-1,0,1\})$ be symmetric with $A_{ij} = 0$ if i,j are not adjacent in G. Then $\Delta(G) \geq \lambda_1(A)$.

Proof.

- Let (λ_1, \vec{v}) be an eigenpair of A. Then $\lambda_1 \vec{v} = A \vec{v}$.
- $\circ~$ Let $\textit{v}_{\textit{j}}$ be the component of $\vec{\textit{v}}$ with the largest absolute value.

$$|\lambda_1| \cdot |v_j| = |\lambda_1 v_j| = |(\lambda_1 \vec{v})_j|$$

Lemma

Lemma

Let

$$A_1 = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \qquad A_n = \begin{bmatrix} A_{n-1} & I \\ I & -A_{n-1} \end{bmatrix}.$$

Then $A_n \in \mathcal{M}_{2^n}(\mathbb{R})$ whose eigenvalues are \sqrt{n} of multiplicity 2^{n-1} , and $-\sqrt{n}$ of multiplicity 2^{n-1} .

Uses Hadamard's inequality. See Huang's talk at Simons Institute.³

$$A_1 = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \qquad A_n = \begin{bmatrix} A_{n-1} & I \\ I & -A_{n-1} \end{bmatrix}.$$

$$A_1 = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \qquad A_n = \begin{bmatrix} A_{n-1} & I \\ I & -A_{n-1} \end{bmatrix}.$$

Proof.

• Prove by induction that $A_n^2 = nI$.

$$A_1 = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \qquad A_n = \begin{bmatrix} A_{n-1} & I \\ I & -A_{n-1} \end{bmatrix}.$$

Proof.

• Prove by induction that $A_n^2 = nI$. For n = 1, $A_1^2 = I$.

$$A_1 = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \qquad A_n = \begin{bmatrix} A_{n-1} & I \\ I & -A_{n-1} \end{bmatrix}.$$

- Prove by induction that $A_n^2 = nI$. For n = 1, $A_1^2 = I$.
- Suppose $A_{n-1}^2 = (n-1)I$. Then

$$A_n^2 = \begin{bmatrix} A_{n-1}^2 + I & 0 \\ 0 & A_{n-1}^2 + I \end{bmatrix} = \begin{bmatrix} nI & 0 \\ 0 & nI \end{bmatrix} = nI.$$

$$A_1 = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \qquad A_n = \begin{bmatrix} A_{n-1} & I \\ I & -A_{n-1} \end{bmatrix}.$$

Proof.

- Prove by induction that $A_n^2 = nI$. For n = 1, $A_1^2 = I$.
- Suppose $A_{n-1}^2 = (n-1)I$. Then

$$A_n^2 = \begin{bmatrix} A_{n-1}^2 + I & 0 \\ 0 & A_{n-1}^2 + I \end{bmatrix} = \begin{bmatrix} nI & 0 \\ 0 & nI \end{bmatrix} = nI.$$

• Hence, the eigenvalues of A_n are either \sqrt{n} or $-\sqrt{n}$.

$$A_1 = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \qquad A_n = \begin{bmatrix} A_{n-1} & I \\ I & -A_{n-1} \end{bmatrix}.$$

- Prove by induction that $A_n^2 = nI$. For n = 1, $A_1^2 = I$.
- Suppose $A_{n-1}^2 = (n-1)I$. Then

$$A_n^2 = \begin{bmatrix} A_{n-1}^2 + I & 0 \\ 0 & A_{n-1}^2 + I \end{bmatrix} = \begin{bmatrix} nI & 0 \\ 0 & nI \end{bmatrix} = nI.$$

- Hence, the eigenvalues of A_n are either \sqrt{n} or $-\sqrt{n}$.
- Since $\sum_{\lambda \text{ eigenvalue of } A} \lambda = \operatorname{tr}(A) = 0$, then exactly half of the eigenvalues of A are \sqrt{n} , and the rest are $-\sqrt{n}$.

• Let G be a "nice" graph with high symmetry. Denote by $\alpha(G)$ the independence number of G, i.e., the size of the largest independent vertex set. Let f(G) be the minimum $\Delta(H)$ over $(\alpha(G)+1)$ -vertex induced subgraphs H of G vertices. What can we say about f(G)? For which graphs, Huang's method would provide a tight bound?

- The best separation between block sensitivity and sensitivity is $bs(f) = \frac{2}{3}s(f)^2 \frac{1}{3}s(f)$ (Ambainis and Sun 2011). Close the gap between this and the quartic upper bound.

Huang's Timeline

Nov 2012: I was introduced to this problem by Michael Saks when I was a postdoc at the IAS, and got immediately attracted by the induced subgraph reformulation. And of course, in the next few weeks, I exhausted all the combinatorial techinques that I am aware of, yet I could not even improve the constant factor from the Chung-Furedi-Graham-Seymour paper, or give an alternative proof without using the isoperimetric inequality.

Around mid-year 2013: I started to believe that the maximum eigenvalue is a better parameter to look at, actually it is polynomially related to the max degree, i.e. \sqrt(\Delta(G)\) \le \landbd(G) \le \Delta(G). And in some sense it reflects some kind of "average degree" (unfortunately the average degree itself could be very small, something like \sqrt(h)/2^A.

2013-2018: I revisited this conjecture every time when I learn a new tool, without any success though. But at least thinking about it helps me quickly fall asleep many nights.

Late 2018: After working on a project (with Pohoata and Klurman) that uses Cvetkovic's inertia bound to re-prove Kleitman's isodiametric theorem (it is another cute proof using algebra solving extremal combinatorial problems), and several semesters of teaching a graduate combinatorics course, I started to have a better understanding of eigenvalue interlacing, and believe that it might help this problem. For example, applying interlacing to the original adjacency matrix, one can already show that with (1/2+c) proportion of vertices, the induced subgraph has maximum degree c'*\sqrt{n}. I don't think this statement could follow easily from combinatorial arguments. Yet at that time, I was hoping for developing something more general using the eigenspace decomposition of the adjacency matrix, like in this unanswered MO guestion:

https://mathoverflow.net/questions/331825/generalization-of-cauchys-eigenvalue-interlacing-theorem

June 2019: In a Madrid hotel when I was painfully writing a proposal and trying to make the approaches sound more convincing, I finally realized that the maximum eigenvalue of any pseudo-adjacency matrix of a graph provides lower bound on the maximum degree. The rest is just a bit of trial-and-error and linear algebra.

Thank you!
